

Crane Safety

Be on the safe side

- 20–25% of all construction fatalities are crane-related.
- Of these accidents, 33% are related to operator error and 30% are related to support failure.
- Crane hoists are designed to lift straight up and to lower straight down only. Side pulls cause dangerous conditions.
- Daily inspections are the simplest, but most overlooked, practice of crane operation. Oceaneering requires them, but they are often not conducted.
